January 8 to January 11, 2024, in Madison Wisconsin at 20 PurpleAir PM2.5 monitors

all measurements in micrograms per cubic meter. PurpleAir PM2.5 monitor readings are averages over 3 days of particulate matter of 2.5 micrometer size, the perfect size to infiltrate the human lung, setting off a cascade of human health problems and early deaths. Wood burning emissions are 90% PM2.5, and wood burning emits more PM2.5 and CO₂ than the fossil fuel coal burning. Wood burning emits 450 times the PM2.5 as the fossil fuel natural gas burning. Many residents buy PurpleAir PM2.5 monitors to prove that as near neighbors of indoor residential wood burners, the wood burning emissions enter the near neighbors yards and sicken them, at levels above Environmental Protection Agency (EPA) National Ambient Air Quality Standards (NAAQS) which in 2023 are 12 micrograms per cubic meter annually and 35 micrograms per cubic meter in a 24 hour period. **The highest average readings are 45 ug/m³ at LAWD& and 35 ug/m³ at Dudgeon. The lowest average reading is 15 ug/m³ at Elmside Circle and 15 ug/m³ at Wexford Village. LaFollette High School has an average reading of 31 and has a cemetery at one side, a road at one side and a golf course at two sides.** LaFollette High School is only 1.8 miles away from 4205 Elinor Street with average reading of 17, but LaFollette High School is not near an indoor residential wood burner. An Excel sheet of all 10 minute readings in a 72 hour period can be downloaded from <https://rawsepresidents.com> at the City Snapshot tab. The individual readings are hidden on the Excel sheet but can be unhidden and viewed.
