

## Research on your Emergency Visit

Comforted on arrival when you seem to be kicking it?

You are also a subject of great interest on licking it

If discomfort comes from a familiar place

The spectrum placed nearby home base

Emergencies like stroke, overdose and cardiac arrest unfold in seconds  
before a patient stabilization or admittance or checking records

For time-sensitive conditions like these,  
the earliest and most critical stages of disease

It is essential to improving patient care and outcomes,

To research care systems and diagnoses outside the home

To improve treatments in the future if not for you

For those who are the luckier few

From bedside to breakthrough

Even if not for you There is a throw

Line An I V line if you will

Avoiding need for a hasty look at your will

Managing serious and complex acute medical conditions,  
including traumatic, oncologic and cardiac interventions.

And coordination when there are high stakes

Especially urgent in your particular case

Also critical for public health research like injury prevention  
and newly emerging diseases arising from infection

You could be a participant in a study!

While keeping your eyes bright and complexion ruddy!
