

The Public Health Ice Cube Pail Challenge.

Public Health Officials go door to door

With a freezer in their car powered by Balcony Solar

With ice cubes continually frozen on the road

And back up stretchers and Emergency vehicles

Trailing the Public Health electric cars.

Public Health Personnel are driving

Into Neighborhoods with Indoor Residential Wood Burning

Based on complaints they are finally responding to,

not first responding to. In the past, they first responded to

First Amendment complaints. Indoor Residential Wood Burners

complained they were only expressing their First Amendment views

as wood burners. By practicing air polluting wood burning. The First

Amendment part called Freedom of Speech. Citizens are protected

in expressing their opinions without government interference, though

courts have recognized certain limits, such as incitement to violence.

Health workers Door to Door Asked "What is your opinion on curing cancer?

Do we need more research on therapies for curing cancer?"

Indoor Residential Wood Burners would rather respond to questions

Such as "How do you feel when you smoke a cigarette?

How do you feel when you inhale indoor residential wood smoke?"

Indoor Residential Wood Burners are experts on answering these questions.

Indoor Residential Wood Burners feel heard by wood burning advertisers

who sold them their indoor residential wood burning stoves. Feeling like experts

with the expert lines fed to them by wood stove advertisers, wood burners

reply "It feels cozy to inhale indoor residential wood smoke".

The poll taken of indoor residential wood burners, taken by Public Health,

going door to door and trying to get a feel for how to talk to wood burners,

followed simple instructions. "Start by listening to indoor residential wood burners.

They will of course say "It feels good to inhale indoor residential wood burning smoke",

Then as medical experts, gently, so you do not lose them, gently suggest that they are

"inhaling cancer causing PM Two point Five which is the perfect size to infiltrate
the human lung setting off a cascade of human health problems and early deaths."

As medical experts gently suggest and nudge the indoor residential wood burners to stop
smoking wood and stop inhaling wood smoke. Theoretically you should have more success

in nudging people to stop indoor residential wood burning since there is no nicotine in
wood unlike the nicotine in cigarettes so wood burning is not a physical addiction.

As Public Health Professionals continuing door to door. You will experience some
slammed doors as well as some breakthroughs. Some Anecdotes exist to power
your walk in search of breakthroughs and wins. Older relatives in back bedrooms

who tolerated the wood burning turned out to have advanced lung cancer and
left their loving relatives in cozy stretchers conveniently provided by Emergency

Vehicles trailing the Health Professionals going door to door. Near Neighbors
to whom the woodsmoke was shunted also ended up in those cozy stretchers
and were transported to temporary relief from wood smoke into hospital rooms
or hospice centers. In those hospital rooms the loving relatives that put them there
with their indoor residential wood burning cheerfully assented to having pails

of ice dumped on them on camera to show their support of cancer therapies after the fact of inflicting their relatives with lung cancer and then expecting cures. Another takeaway from this experience. It is easier to just stop wood burning to begin with. It is better for the planet to just stop wood burning.
