

Coasts of California from North to South are endangered
Not initially from forces of nature but first endangered
From one man because he is enraptured, in fossil fuel thrall,
So he attempts to wipe out clean competition to gas and oil.
At a time when Wind especially is lower in price
And Wind and Solar can be stored in battery space
For times when the Wind does not blow and the Sun does not shine.
The Governor of California and his predecessor explain the whine
Of Presidential lawsuits piling up as distraction from Midterm elections
Also explainable as Presidential Financial Scandal distractions.
Does the President truly believe that because Sable fixed the spill
Eleven years ago that oil spills will not happen in the future or until
The end of time we can forget that oil pollutes our air as well as water?
Does the President truly believe in invoking the Defense Production
Act, a Cold War-era law that he said superseded state regulations?
It typically is invoked in emergencies like hurricanes and the Covid-19 pandemic.
The emergency cited is energy shortage in California fossil fuels when war choked
global oil supplies because the Strait of Hormuz is shut down by war choice
of the Commander in Chief himself who is ignoring clean energy choices.
At the same time the President also paid energy companies hundreds of millions
Of dollars to cancel planned Wind farms off the coast of California. Millions
In taxpayer dollars is squandered to support the fading fossil fuel industry
As it desperately attempts to tighten its grip on the world economy even as clean energy
dominates, growing cheaper and faster to deploy than anything fossil fuel can offer.
A second Presidential plan calls for up to six oil and gas lease sales in California waters,
including off Santa Barbara where a Nineteen Sixty Nine oil spill galvanized the modern
environmental movement. At least Six Presidential federal agencies are working to undermine
California efforts to pivot away from fossil fuels. Last week, the Presidential National Oceanic
and Atmospheric Administration, meant to manage oceans, atmosphere, and climate
was subverted to instead to simply do the opposite and deliberately work against those aims.
The Presidential N.O.A.A. instead acted to curb the power of the California Coastal Commission
protection of the California Coast from threats like oil spills by reducing Ten percent of its funding.
The Nineteen Seventy Clean Air Act allowed California to set automobile pollution standards ending
up stricter than federal rules with E P A waivers. The landmark law allowed other states to adopt
the California standards. California has filed lawsuits to protect its environment. On August
Nineteenth, At a hearing this month, a Presidential Justice Department attorney argued that
the state lacked standing to sue over retention of four E P A waivers. Congress had not yet acted
on them. A federal judge will soon decide that question. The outcome of these legal battles
could dictate the types of gas powered vehicles available at dealerships nationwide. Rattled,
the Presidential Energy Department announced Seventy Five Million Dollars for a new coal export
terminal in Oakland, California. The President stopped Wind Farm Clean Energy Projects
with taxpayer money payoffs. The President Propped up Coal although Wood Burning emits Two
point Eight Times the PM Two point Five. Wood Burning is not additionally touched by Presidential Chaos
so far because PM Two point Five is not a Greenhouse Gas and air pollution laws against PM Two point
Five do not often exist. But all Dirty Fossil and Solid Fuels could be lumped together in a California venue.
